

SUMMARY

"RACK FOR HORIZONTALLY SUPPORTING AND STORING BOTTLES"

This includes a surface with an upper relief which defines a rack to horizontally store bottles. Each rack is
5 defined by a wide area with the opposite area being narrower. Each rack includes the first two compartments which are parallel to each other on the same plane and a second inverted elevated compartment. The narrower area of second compartment is enclosed between the wider areas
10 of the first compartment and is in contact with the wider area of these. The plane of the second compartment is higher than the first two compartments' planes and is equal to the size of the wider area of the compartments.

This saves space when compared to conventional
15 systems because the bottle in the second compartment is inserted more deeply between the pair of compartments.
